Funngro Website Revamp

Preliminary SEO Audit & Implementation Report

Prepared for the two-page concept redesign (Company and Teen pages), with a landing page for navigation. This is a manual preliminary audit of publicly visible pages and the prototype; it is not a paid crawl or a Search Console report.

1. Scope and approach

Reviewed the public Funngro website messaging and created a responsive concept prototype with separate Company and Teen landing pages. The prototype includes page titles, meta descriptions, responsive viewport settings, semantic headings, internal navigation, and Open Graph metadata.

2. Findings and recommendations

- Page intent: keep the Company page focused on project briefs, collaboration and business outcomes; keep the Teen page focused on practical skills, project experience and learning.
- Title tags: use a unique, descriptive title for each page. The prototype includes distinct titles for the overview, Company and Teen pages.
- Meta descriptions: write a unique summary for each page that explains its value and encourages a relevant click. The prototype includes descriptions on all three pages.
- Canonical URLs: the prototype currently uses example.com placeholders. Replace these with the real published URLs before submission; do not leave placeholders in a live site.
- Heading structure: use one clear H1 per page, followed by meaningful H2/H3 sections. The prototype follows this hierarchy.
- Mobile usability: the layout uses a responsive viewport and CSS breakpoints for small screens. Verify the live site on a real phone after publishing.
- Internal links: the overview links to both Company and Teen pages; each page links back to the overview and across to the other audience page.
- Content quality: use specific, verifiable claims only. The concept avoids presenting invented testimonials or guaranteed earnings as facts.
- Images and performance: the prototype uses CSS shapes instead of large image files. If real images are added later, compress them and provide descriptive alt text.
- Measurement: after launch, use Google Search Console and an SEO crawler to check indexing, crawl errors, Core Web Vitals, structured data and actual search queries.

3. Technical SEO checklist

- ■ HTML language and UTF-8 character encoding
- ■ Responsive viewport declaration
- ■ Unique title and meta description per page
- ■ Semantic navigation and heading hierarchy
- ■ Internal links between all project pages
- ■ Open Graph title and description metadata
- ■ Replace canonical URL placeholders after publishing

- ■ Test live URLs for HTTP status and broken links
- ■ Run Google PageSpeed Insights / Lighthouse on the published site
- ■ Add a sitemap.xml and robots.txt if appropriate for the final domain
- ■ Verify ownership in Google Search Console and request indexing where appropriate

4. Limitations

This report does not claim measured rankings, traffic, Core Web Vitals scores, backlink counts, or index coverage. Those require live testing and/or analytics access. The website is a student concept prototype, not an official Funngro property. Confirm the task's submission rules before publishing or presenting it as a company-approved redesign.

5. Recommended next actions

Publish the files, replace canonical URL placeholders, test both pages on mobile, run a live SEO audit, record any measured findings, and submit the public website URL plus this report in the Funngro project remarks.
